

Smart Retail Operations

1. Order Fulfilment Process

A retail company receives orders from its website and mobile application. Each order is validated before inventory is reserved. The warehouse then picks, packs, and dispatches the product. Delivery status is updated after the logistics partner accepts the shipment.

Order Processing Flow

Order Status Table

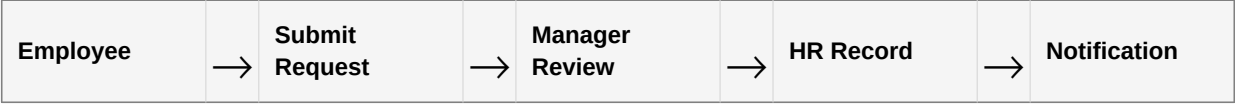

Order ID	Customer	Item	Qty	Status
ORD-1001	Alice	Laptop	1	Shipped
ORD-1002	Daniel	Keyboard	2	Packed
ORD-1003	Meera	Monitor	1	Processing
ORD-1004	John	Mouse	3	Delivered

Operational note: orders with unavailable inventory are placed on hold. Customers receive an automatic notification when the order status changes.

Employee Leave Management

2. Leave Approval Workflow

Employees submit leave requests through the HR portal. The manager reviews the requested dates and team availability. Approved requests are recorded in the leave calendar, while rejected requests are returned with a reason.

Leave Balance

Employee	Annual	Sick	Used	Remaining
Anita	18	12	5	13
Robert	18	12	9	9
Chen	20	14	7	13
Sara	18	12	3	15

Policy: employees should normally submit planned leave at least five working days in advance. Emergency leave can be submitted on the same day with an explanatory note.

Bank Loan Application

3. Credit Assessment

A bank evaluates personal loan applications using identity verification, income information, existing liabilities, requested loan amount, and credit history. Applications that satisfy automated checks can proceed to underwriting. Higher-risk applications require manual review.

Sample Applicant Data

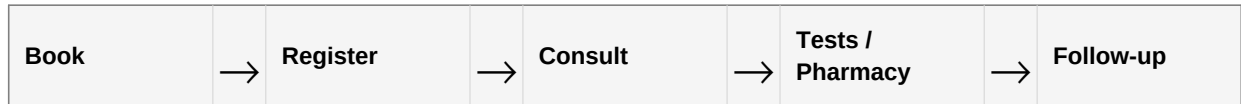

Applicant	Income / Month	Loan Amount	Credit Score	Decision
A101	\$7,500	\$20,000	780	Approved
A102	\$4,200	\$35,000	645	Review
A103	\$9,000	\$15,000	810	Approved
A104	\$3,800	\$40,000	590	Rejected

Risk rules are only one part of the decision. A manual underwriter may request additional documents such as paylips or bank statements before making a final decision.

Hospital Appointment System

4. Patient Journey

Patients can book appointments online or through a call centre. At the hospital, registration staff verify patient information before consultation. The doctor may prescribe medication, request laboratory tests, or schedule a follow-up visit.

Department Schedule

Department	Doctor	Room	Available Days	Time
Cardiology	Dr. Lim	C-201	Mon, Wed, Fri	09:00–13:00
Dermatology	Dr. Tan	D-105	Tue, Thu	10:00–16:00
Orthopaedics	Dr. Kumar	O-310	Mon–Fri	08:30–12:30
Paediatrics	Dr. Wong	P-110	Mon–Sat	09:00–17:00

Patients should arrive approximately fifteen minutes before the appointment for registration. Appointment availability depends on department schedules and doctor availability.

IT Incident Management

5. Production Incident Response

When a production incident occurs, the support team creates an incident ticket and assigns a severity level. Engineers investigate logs, metrics, recent deployments, and dependent services. Critical incidents are escalated immediately and tracked until service is restored.

Incident Severity Matrix

Severity	Impact	Target Response	Example
SEV-1	Critical outage	15 minutes	Checkout unavailable
SEV-2	Major degradation	30 minutes	High API latency
SEV-3	Limited impact	4 hours	Reporting delay
SEV-4	Minor issue	1 business day	UI formatting issue

Post-incident reviews document the timeline, root cause, customer impact, corrective actions, and owners. The objective is to reduce the probability and impact of similar incidents in the future.

RAG Testing Ideas

This mixed-content document can be used to test paragraph extraction, table extraction, layout-aware chunking, section metadata, semantic retrieval, and questions that require information from both prose and tables.
